Algorithm design and analysis

Big O - Algorithm Analysis

Nguyễn Quốc Thái

Data Structures and Algorithms

Relation between Data Structures and Algorithms

> **Program = Data Structures + Algorithms**

➤ Data structure:

- a way of organizing, storing and performing operations on data

- examples: list, set, dictionary,…

➤ Algorithm:

- describes a sequence of steps to solve a computational problem or perform a calculation

- described in pseudocode, a programming language

Objectives

Objectives of Learning Algorithms

"Life is meaningful, without objective life is vague

At this moment our goal is to learn Algorithms."

➢ Algorithm efficiency is typically measured by the algorithm's computational complexity

➢ Computational complexity is the amount of resources used by the algorithm

Algorithm

Design an algorithm

➤ Prove the algorithm is correct

    Loop invariant, recursive function,

Analysis the algorithm

➤ Time

➤ Space

Sequential and parallel algorithms

➤ Random access model (RAM)

➤ Parallel Multi-processor access model (PRAM)

Cho một số nguyên dương n, viết phương trình đảo ngược thứ tự các vị trí trong số n. Chỉ dùng while (hay for) và những phép toán cơ bản như +, -, *, /, %, // ...

- Input: n là một dãy số nguyên dương.
- Output: Đảo ngược vị trí các số trong n. Ví dụ input: 12345678910, output: 1987654321

NOTE: Các bạn chú ý các điều kiện sau

- Không được ép kiểu sang string
- Chỉ sử dụng while hoặc for loop

```python
def reverse_number(n):
    r_num = 0
    while n > 0:
        reminder = n % 10
        r_num = (r_num * 10) + reminder
        n = n // 10 #//: chia làm tròn xuống
    return r_num

print(reverse_number(12))

print(reverse_number(n=123456789))
```

```
21
987654321
```

Algorithm efficiency

Experimental Analysis

➢ Computational complexity is the amount of resources used by the algorithm

➢ Independent of the hardware and software environment

➢ Study a high-level description of the algorithm without need for implementation

➢ Takes into account all possible

⇒ The most common resources considered :

Runtime (time) complexity

Memory usage (space) complexity

Running Time

The 'time' function of the time module

```
[4]  import time
     start_time = time.time()

     i = 0
     while i < 5:
         i = i + 1

     end_time = time.time()

     print(end_time-start_time)

5.76972961425781258e-05
```

```
[ ]  import time
     start_time = time.time()

     # run algorithm

     end_time = time.time()

     print(end_time-start_time)
```

(2)

$$O(n^2)$$

Primitive Operations

Important Function

Computational complexity

Primitive Operations

➤ Assigning an identifier to an object

➤ Performing an arithmetic operation

➤ Comparing two numbers

```
number_a = 10
number_b = number_a
number_a + number_b
```

```
20
```

```
add_number = number_a + number_b
add_number
```

```
20
```

```
number_a > number_b
```

```
False
```

```
compare_number = number_a > number_b
compare_number
```

```
False
```

Computational complexity

Primitive Operations

➤ Accessing a single element of list by index

➤ Calling a function

➤ Returning from a function

```python
list_number = [1, 2, 3]
list_number[0]
```

```
1
```

```python
def sum_list(list_number):
    total = sum(list_number)
    return total

sum_list(list_number)
```

```
6
```

Computational complexity

Counting Primitive Operations

➢ The number of primitive operations an algorithm performs will be proportional to the actual running time

Measuring Operations as a Function of Input Size

➢ To capture the order of growth of an algorithm's running time

➢ A function $f(n)$: characterizes the number of primitive operations that are performed as a function of the input size n

➢ Common functions: $f(n) = c, log_b n, n, nlogn, ...$

Simple algorithm analysis

$$O(n)$$

"Big-Oh" Notation

The number of primitive operations that are performed

```

O(logn)

4

Objectives

Different searching algorithms

➢ Suppose $n=10^{10}$ numbers:

- Linear search: $c_1 n$

- Binary search: $c_2(log n)$

Case 1: The same programmer ($c_1=c_2=1$), computer (1 billion/second)

Linear search	Binary search
$1*(10^{10})$ instructions/10^9 instructions per second $= 10$ seconds	$1*log(10^{10})$ instructions/10^9 instructions per second $\approx 3.3*10^{-8}$ seconds

Objectives

Different searching algorithms

➢ Suppose $n = 10^{10}$ numbers:

- Linear search: $c_1 n$

- Binary search: $c_2 (\log n)$

Case 2: Best programmer ($c_1 = 1$), bad programmer ($c_2 = 50$)

The same computer (1 billion/second)

	Linear search	Binary search
Best programmer	$1*(10^{10})/10^9 = 10$ seconds	$1*\log(10^{10})/10^9 \approx 3.3*10^{-8}$ seconds
Bad programmer	$50*(10^{10})/10^9 = 500$ seconds	$50*\log(10^{10})/10^9 \approx 1.65*10^{-6}$ seconds

Objectives

Different searching algorithms

➢ Suppose $n=10^{10}$ numbers:

- Linear search: $c_1 n$

- Binary search: $c_2(\log n)$

Case 3: The same programmer ($c_1 = c_2 = 1$), language (python),

Computer A (1 billion/second), computer B (10 million/second)

	Linear search	Binary search
Computer A	$1*(10^{10}) /10^9 = 10$ seconds	$1*\log(10^{10}) /10^9 \approx 3.3*10^{-8}$ seconds
Computer B	$1*(10^{10}) /10^7 = 10^3$ seconds	$1*\log(10^{10}) /10^7 \approx 3.3*10^{-6}$ seconds

Objectives

Different searching algorithms

➤ Suppose $n = 10^{10}$ numbers:

- Linear search: $c_1 n$
- Binary search: $c_2 (\log n)$

Case 4: $<A>$: best programmer ($c_1 = 1$), computer A (1 billion/second)

                $<B>$: bad programmer ($c_2 = 50$), computer B (10 million/second)

	Linear search	Binary search
$<A>$	$1*(10^{10}) / 10^9 = 10$ seconds	$1*\log(10^{10}) / 10^9 \approx 3.3*10^{-8}$ seconds
$<B>$	$50*(10^{10}) / 10^7 = 5*10^4$ seconds	$50*\log(10^{10}) / 10^7 \approx 1.66.10^{-4}$ seconds

=> **Binary search on $<B>$ is 60.000 times faster than binary search on A**
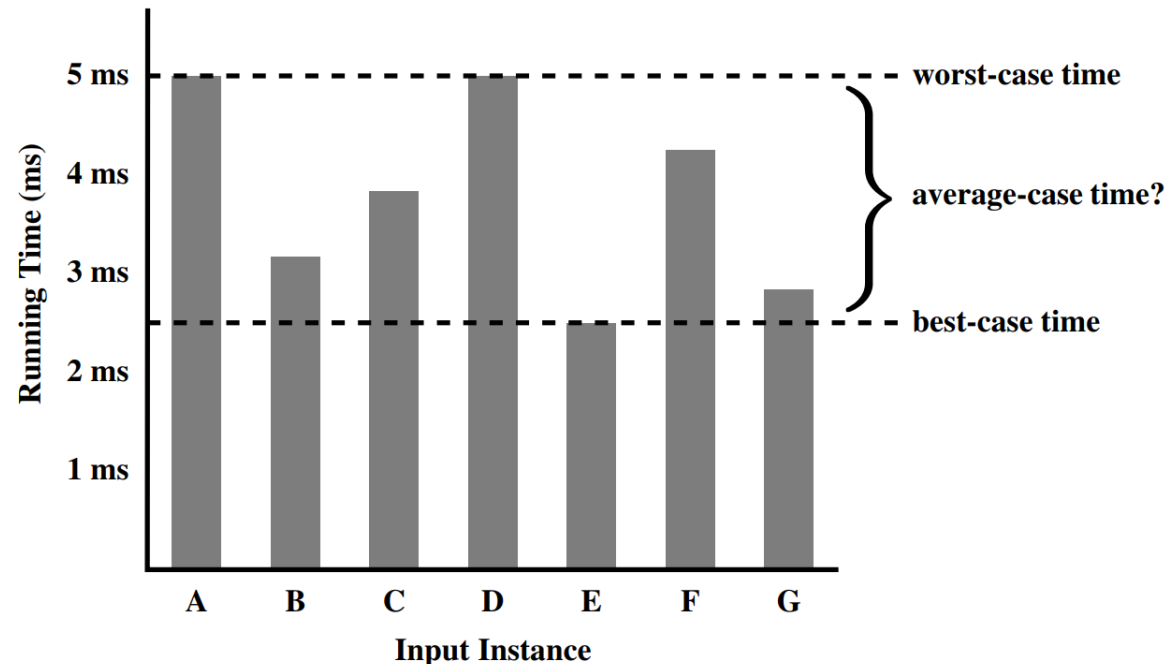

Computational complexity

Running time

Takes into account all possible inputs

➢ Worst case, best case, average case

➢ For some algorithms, worst case occurs often, average case is often roughly as bad as the worst case. So generally, worse case running time

$$O(n^2)$$

Primitive Operations

Important Function

Computational complexity

The seven most important functions

➢ The constant function: $f(n) = c$

- Any argument n, $f(n)$ assigns the value c.

- $c = 5, 10, 2^{10},\ldots$

- Basic operation: comparing two numbers,…

```python
def find_max_number(number_a, number_b):
    number_max = 0
    if number_a > number_b:
        number_max = number_a
    else:
        number_max = number_b
    return number_max
```

Computational complexity

The seven most important functions

➢ The logarithm function:

$$f(n) = \log_b n \quad \text{if and only if } b^x = n, \quad b > 1$$

- b: base of the logarithm (computer science is 2)

- $\log_b 1 = 0$

- For any real numbers a>0, b>1, c>0, n:

$$\log_b ac = \log_b a + \log_b c \qquad \log_b a/c = \log_b a - \log_b c$$

$$\log_b a^n = n\log_b a \qquad b^{\log_d a} = a^{\log_d b}$$

$$\log_b a = \log_d a/\log_d b$$

```python
def binary_search(array, key):
    low = 0
    high = len(arr) - 1

    while low <= high:

        mid = low + (high - low)//2

        if arr[mid] == key:
            return mid

        elif arr[mid] < key:
            low = mid + 1

        else:
            high = mid - 1

    return -1

arr = [1, 2, 10, 15, 23]
key = 23

binary_search(arr, key)
```

Computational complexity

The seven most important functions

➤ The linear function: $f(n) = n$

- The best running time to achieve for any algorithm

- Comparing a number x to each element of a sequence of size n

➤ The N-Log-N function: $f(n) = n\log n$

- The fastest possible algorithms for sorting

```
[29] x = 10
     y = 20
     n = 10
     for i in range(n):
         z = x + y
         t = x - y
```

```
[47] n = 10
     i = 5
     total = 0
     while i < n:
         total = total + i
         i = i + 1
```

Computational complexity

The seven most important functions

➢ The Quadratic function: $f(n) = n^2$

■ Appears often in algorithm analysis: nested loops

■ For any integer $n \geq 1$:

$$\sum_{i=1}^{n} i = 1 + 2 + 3 + \ldots + (n - 2) + (n - 1) + n = \frac{n\,(n + 1)}{2}$$

```
[32]  x = 10
      y = 20
      n = 10
      for i in range(n):
          x = x + i
          y = y + i
          for j in range(n):
              z = x + y
              t = x - y
```

```
n = 10
i = 0
total = 0
while i < n:
    total = total + i
    i = i + 1
    j = 0
    while j < n:
        total = total + j
        j = j + 1
```

Computational complexity

The seven most important functions

➤ The Cubic function: $f(n) = n^3$

- Polynomials:

$$f(n) = a_0 + a_1 n + a_2 n^2 + \cdots + a_d n^d = \sum_{i=0}^{d} a_i n^i$$

$a_0, a_1, a_2,\ldots$: constants => coefficients, $a_d \neq 0$. d: highest power => degree

```
[49] n = 10
     for i in range(n):
         for j in range(n):
             for k in range(n):
                 print(i*j*k)
```

Computational complexity

The seven most important functions

➤ The Exponential function: $f(n) = b^n$

  ▪ b: positive constant => base

  ▪ n => exponent

For any n ≥ 0, a > 0, a ≠ 1: $\sum_{i=0}^{n} a^i = 1 + a + a^2 + \ldots + a^n = \frac{a^{n+1} - 1}{a - 1}$
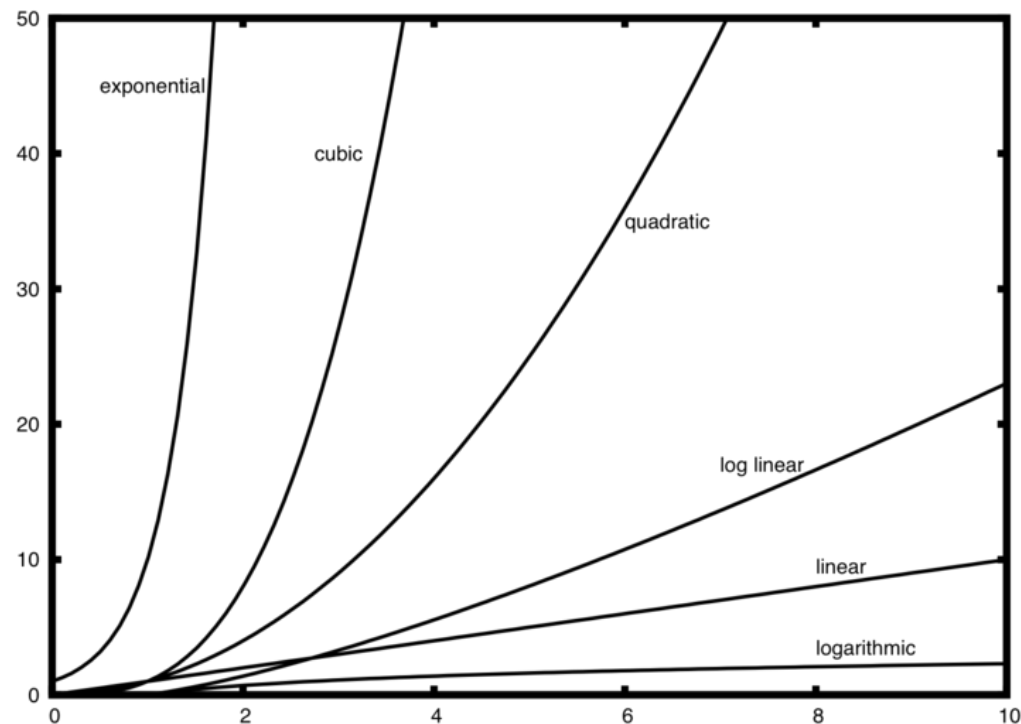

Computational complexity

Asymptotic Notation

$$O(n^2)$$

Primitive Operations

Important Function

Asymptotic Analysis

Asymptotic Analysis

"Big-Oh" Notation

➢ If f(n) and g(n): two non-negative functions of non-negative arguments

f(n) is $O(g(n))$ if there is a real constant c>0 and an integer constant $n_0 \geq 1$:
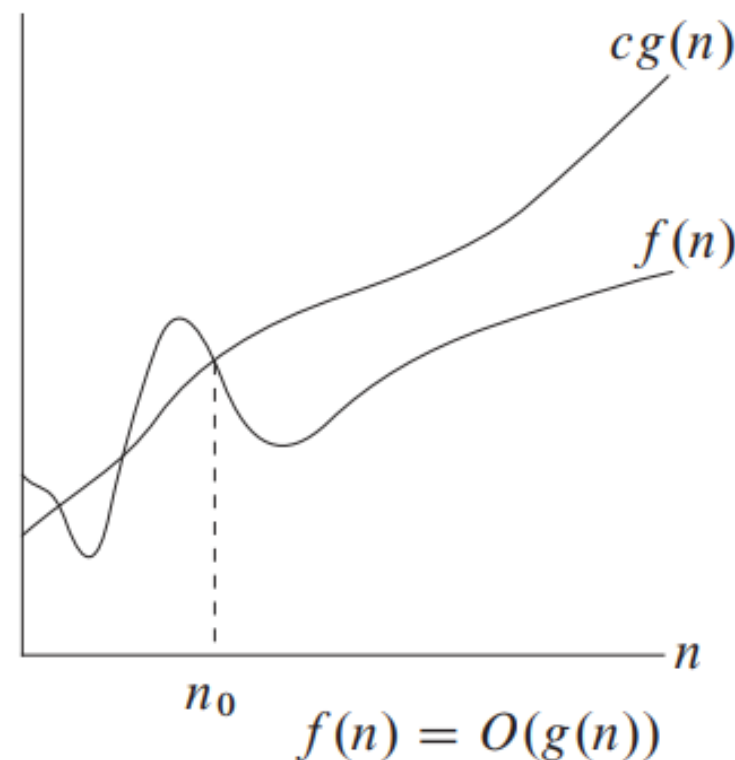

$$f(n) \leq cg(n), \text{ for } n \geq n_0$$

"less-than-or-equal-to"

➢ **Example**: f(n) = 8n + 5 is O(n)

Find c>0 and $n_0 \geq 1$

$8n + 5 \leq cn$, for every integer $n \geq n_0$

=> A possible choice is c = 13 and n_0=1

$cg(n)$

$f(n)$

n_0

n

$f(n) = O(g(n))$

Asymptotic Analysis

"Big-Oh" Notation

➤ Some properties of the Big-Oh Notation

- Lower order items are ignored, just keep the highest order item

- The constant coefficients are ignored

- The rate (/order) of growth possesses the highest significance

➤ **Example**:

$f(n) = 5n^4 + 3n^3 + 2n^2 + 4n + 1$ is $O(n^4)$

$f(n) = 5n^4 + 3n^3 + 2n^2 + 4n + 1 \leq (5+3+2+4+1)n^4 = cn^4$

$\Rightarrow c = 15, n \geq n_0 = 1$

f(n) is a polynomial of degree d, $a_d > 0$ => f(n) is $O(n^d)$

Computational complexity

"Big-Oh" Notation

Some rules:

$f(n) = 7n + 7$, $g(n) = 3n\log n$

➤ $O(c.f(n)) = O(f(n))$

   => $f(n)$ is $O(n)$

➤ $O(f(n) + g(n)) = O(\max(f(n), g(n)))$

   => $T(n)$ is $O(n\log n)$

➤ $O(f(n).g(n)) = O(f(n)).O(g(n))$

   => $T(n)$ is $O(n^2 \log n)$

$$f(n) = O(g(n))$$

Asymptotic Analysis

"Big-Oh" Notation

➢ If f(n) and g(n): two non-negative functions of non-negative arguments

f(n) is O(g(n)) if there is a real constant c>0 and an integer constant $n_0 \geq 1$:

$f(n) \leq cg(n)$, for $n \geq n_0$

➢ **Example**: $f(n) = 8n^3 + 5n$

f(n) = $13n^3$
=> f(n) is O(n^3)

h(n) = $13n^5$
=> f(n) is O(n^5)

TRUE???
f(n) is ???

$c'h(n)$

$cg(n)$

$f(n)$

n_0

n

$f(n) = O(g(n))$

Asymptotic Analysis

"Big-Oh" Notation

➢ If $f(n)$ and $g(n)$: two non-negative functions of non-negative arguments

$f(n)$ is $O(g(n))$ if there is a real constant $c>0$ and an integer constant $n_0 \geq 1$:
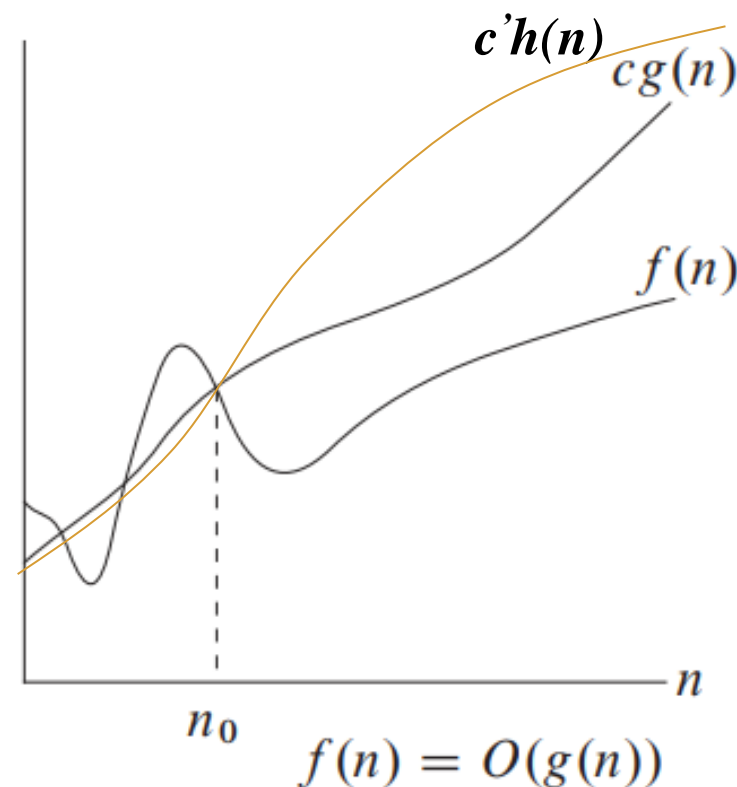

$$f(n) \leq cg(n), \text{ for } n \geq n_0$$

➢ **Example**: $f(n) = 8n^3 + 5n$

Simplest Terms

$f(n) = 13n^3$
$\Rightarrow f(n)$ is $O(n^3)$

TRUE???
$f(n)$ is ???

$h(n) = 13n^5$
$\Rightarrow f(n)$ is $O(n^5)$

$c'h(n)$

$cg(n)$

$f(n)$

n_0

n

$f(n) = O(g(n))$

Asymptotic Analysis

"Big-Omega" Notation

➢ If $f(n)$ and $g(n)$: two non-negative functions of non-negative arguments

$f(n)$ is $\Omega(g(n))$ if there is a real constant $c>0$ and an integer constant $n_0 \geq 1$:

$$f(n) \geq cg(n), \text{ for } n \geq n_0$$

"greater-than-or-equal-to"

➢ **Example**: $f(n) = 3n\log n - 2n$ is $\Omega(n\log n)$

Find $c>0$ and $n_0 \geq 1$:

$3n\log n - 2n = n\log n + 2n(n\log n - 1)$

$\geq n\log n$, for every integer $n \geq n_0 = 2$

$\Rightarrow c = 1, n_0 = 2.$

$f(n)$

$cg(n)$

n_0

n

$f(n) = \Omega(g(n))$

Asymptotic Analysis

"Big-Theta" Notation

➢ If $f(n)$ and $g(n)$: two non-negative functions of non-negative arguments

$f(n)$ is $\Theta(g(n))$ if there is a real constant c_1, $c_2 > 0$ and an integer constant $n_0 \geq 1$:

$$c_1 g(n) \leq f(n) \leq c_2 g(n), \text{ for } n \geq n_0$$

$f(n)$ is $\Theta(g(n))$ if $f(n)$ is $O(g(n))$ and $f(n)$ is $\Omega(g(n))$

➢ **Example**: $f(n) = 3n\log n + 4n + 5\log n$ is $\Theta(n\log n)$

Find c_1, $c_2 > 0$ and $n_0 \geq 1$

$3n\log n \leq 3n\log n + 4n + 5\log n \leq (3+4+5)n\log n$

$\Rightarrow 3n\log n \leq 3n\log n + 4n + 5\log n \leq 12n\log n$

$\Rightarrow c_1 = 3, c_2 = 12$ and $n_0 = 2$

$c_2 g(n)$

$f(n)$

$c_1 g(n)$

c) $5n^2 + 3n\log n + 2n + 5$ is $O(n^2)$

d) $3\log n + 2$ is $O(\log n)$

e) $3n\log n - 2n$ is $\Omega(n\log n)$

f) n^2 is $\Omega(n\log n)$

g) $3n\log n + 4n + 5\log n$ is $\Theta(n\log n)$

Justification

a) $(n+1)5$ is $O(n5)$

$(n+1)^5 = n^5 + 5n^4 + 10n^3 + 10n^2 + 5n + 1$

$\qquad \leq (1+5+10+10+5+1)n^5 = cn^5$

$\qquad \Rightarrow c=32, n_0=1$

b) 2^{n+1} is $O(2^n)$

$2^{n+1} = 2^n.2 = c2^n$

$\qquad \Rightarrow c=2, n_0=1$

c) $5n^2 + 3n\log n + 2n + 5$ is $O(n^2)$

$\qquad \leq (5+3+2+5)n^2 = cn^2$

$\qquad \Rightarrow c=15, n_0=1$

Exercise

Question 1

a) $(n+1)^5$ is $O(n^5)$

b) 2^{n+1} is $O(2^n)$

c) $5n^2 + 3n\log n + 2n + 5$ is $O(n^2)$

d) $3\log n + 2$ is $O(\log n)$

e) $3n\log n - 2n$ is $\Omega(n\log n)$

f) n^2 is $\Omega(n\log n)$

g) $3n\log n + 4n + 5\log n$ is $\Theta(n\log n)$

Justification

d) $3\log n + 2$ is $O(\log n)$

$3\log n + 2 = 3\log n + 2\log 1$

$\qquad \leq (3+2)\log n = c\log n$

$\qquad => c=5, n_0=2$

e) $3n\log n - 2n$ is $\Omega(n\log n)$

$3n\log n - 2n = n\log n + 2n(\log n - 1)$

$\qquad \geq n\log n$

$\qquad => c=2, n_0=1$

f) n^2 is $\Omega(n\log n)$

$n^2 = n.n \geq n\log n => c=1, n_0=1$

Question 1

a) $(n+1)^5$ is $O(n^5)$

b) 2^{n+1} is $O(2^n)$

c) $5n^2 + 3n\log n + 2n + 5$ is $O(n^2)$

d) $3\log n + 2$ is $O(\log n)$

e) $3n\log n - 2n$ is $\Omega(n\log n)$

f) n^2 is $\Omega(n\log n)$

g) $3n\log n + 4n + 5\log n$ is $\Theta(n\log n)$

Justification

g) $3n\log n + 4n + 5\log n$ is $\Theta(n\log n)$

$3n\log n \leq 3n\log n + 4n + 5\log n \leq (3+4+5)n\log n$

$3n\log n \leq 3n\log n + 4n + 5\log n \leq 12n\log n$

$\Rightarrow c_1 = 3, c_2 = 12, n_0 = 2$

Exercise

Question 2

a) $4n\log n + 2n$ $\quad$ 2^{10} $\quad$ $2^{\log n}$

b) $n^2 + 10$ $\quad$ n^3 $\quad$ $n\log n$

c) $4^{\log n}$ $\quad$ $4n$ $\quad$ $n^{1/\log n}$

Exercise

Question 2

a) $4n\log n + 2n$ 2^{10} $2^{\log n}$

$\Rightarrow$ $4n\log n + 2n$ is $O(n\log n)$ 2^{10} is $O(1)$ $2^{\log n}=n$ is $O(n)$

$\Rightarrow$ $4n\log n + 2n$ $\leq$ $2^{\log n}$ $\leq$ 2^{10}

b) $n^2 + 10$ n^3 $n\log n$

$\Rightarrow$ $n^2 + 10$ is $O(n^2)$ n^3 is $O(n^3)$ $n\log n$ is $O(n\log n)$

$\Rightarrow$ $n\log n$ $\leq$ $n^2 + 10$ $\leq$ n^3

c) $4^{\log n}$ $4n$ $n^{1/\log n}$

$\Rightarrow$ $4^{\log n}$ is $O(n^2)$ $4n$ is $O(n)$ $n^{1/\log n}$ is $O(1)$

$\Rightarrow$ $n^{1/\log n}$ $\leq$ $4n$ $\leq$ $4^{\log n}$

Exercise

Question 3

a)

```python
def step_example1(n):
    i = 1
    count = 0
    while i < n:
        print(i)
        i *= 2
        count += 1
    return count
```

Exercise

Question 3

Question 3

c)

```python
def uniq_example1(S):
    n = len(S)
    for i in range(n):
        for j in range(i+1, n):
            if S[i] == S[j]:
                return False
    return True
```

```python
def uniq_example2(S):
    n = len(S)
    S_temp = sorted(S)
    for i in range(n-1):
        if S_temp[i] == S_temp[i+1]:
            return False
    return True
```

T(n) is O(n^2)

T(n) is O(nlogn)

Exercise

Question 4: Running time analysis: worst, best, average case

```python
def insertion_sort(S):
    n = len(S)
    for step in range(1, n):
        key = S[step]
        i = step - 1
        while i >= 0 and key < S[i]:
            S[i + 1] = S[i]
            i = i - 1
        S[i + 1] = key
    return S
```

Exercise

Question 4

	cost	times
1. def insertion_sort(s):		
2. n = len(s)	c_0	1
3. for step in range(1, n):	c_1	n
4. key = s[step]	c_2	n-1
5. i = step − 1	c_3	n-1
6. while i >= 0 and key < s[i]	c_4	$\sum_{i=1}^{n-1} t_i$
7. s[i+1] = s[i]	c_5	$\sum_{i=1}^{n-1}(t_i-1)$
8. i = i − 1	c_6	$\sum_{i=1}^{n-1}(t_i-1)$
9. s[i+1] = key	c_7	n-1
10. return s	c_8	1

t_i is the number of times while loop test in line 6 is executed for that value of i

$$T(n) = c_0 + c_1 n + c_2(n-1) + c_3(n-1) + c_4 \sum_{i=1}^{n-1} t_i + c_5 \sum_{i=1}^{n-1}(t_i-1) + c_6 \sum_{i=1}^{n-1}(t_i-1) + c_7(n-1) + c_8$$

Exercise

Question 4

$T(n) = c_0 + c_1 n + c_2(n-1) + c_3(n-1) + c_4 \sum_{i=1}^{n-1} t_i + c_5 \sum_{i=1}^{n-1}(t_i-1) + c_6 \sum_{i=1}^{n-1}(t_i-1) + c_7(n-1) + c_8$

➢ Best case: already ordered numbers

- $t_i=1$, line 7 and 8 will be executed 0 times

- $T(n) = c_0 + c_1 n + c_2(n-1) + c_3(n-1) + c_4(n-1) + c_7(n-1) + c_8$

  $= (c_1 + c_2 + c_3 + c_4 + c_7)n + (c_0 + c_8 - c_2 - c_3 - c_4 - c_7)$

  $= cn + c'$

  $=> O(n)$

Exercise

Question 4

$T(n) = c_0 + c_1 n + c_2 (n-1) + c_3 (n-1) + c_4 \sum_{i=1}^{n-1} t_i + c_5 \sum_{i=1}^{n-1} (t_i - 1) + c_6 \sum_{i=1}^{n-1} (t_i - 1) + c_7 (n-1) + c_8$

➤ Worst case: reverse numbers

- $t_i = i$, line 7 and 8 will be executed i times

- $\sum_{i=1}^{n-1} t_i = \sum_{i=1}^{n-1} i = n(n+1)/2 - 1$, and $\sum_{i=1}^{n-1} (t_i - 1) = \sum_{i=1}^{n-1} (i-1) = n(n-1)/2$

- $T(n) = c_0 + c_1 n + c_2 (n-1) + c_3 (n-1) + c_4 (n(n+1)/2 - 1) + c_5 n(n-1)/2$

  $+ c_6 n(n-1)/2 + c_7 (n-1) + c_8$

  $= an^2 + bn + c$

  $\Rightarrow O(n^2)$

➤ Average case: random numbers

- $t_i = i/2 \Rightarrow$ The same worst case: $O(n^2)$

Exercise

Question 5

a) $\sum_{i=1}^{n} \log i$ is O(nlogn)

b) $\sum_{i=1}^{n} \log i$ is Θ(nlogn)

c) Let $p(n) = \sum_{i=1}^{d} a_i n^i$, where $a_d > 0$. Let k be a constant. Use the definitions of the asymptotic notation to prove the following properties:

      (i) Nếu k ≥ d, thì p(n) = O(n^k)

      (ii) Nếu k = d, thì p(n) = Θ(n^k)

Exercise

Question 5

a) $\sum_{i=1}^{n} \log i = \log 1 + \log 2 + \dots + \log n = \log(1*2*\dots*n)$

$\leq \log(n*n*\dots*n) = n \log n$

$\Rightarrow \sum_{i=1}^{n} \log i$ is $O(n\log n)$

b) $\sum_{i=1}^{n} \log i \geq \sum_{i=n/2}^{n} \log i = \log\left(\frac{n}{2}\right) + \log\left(\frac{n}{2} + 1\right) + \dots + \log(n)$

$= \log n - \log 2 + \log(n+3) - \log 2 + \dots + \log n$

$\geq \log n - \log 2 + \log n - \log 2 + \dots + \log n$

$= n/2 \log n - (n/2-1)\log 2$

$\Rightarrow \sum_{i=1}^{n} \log i$ is $\Omega(n\log n)$

$\Rightarrow \sum_{i=1}^{n} \log i$ is $\Theta(n\log n)$

Exercise

Question 5

c) $p(n) = \sum_{i=0}^{d} a_i n^i$, $a_d > 0$

(i) – p(n) is $O(n^k)$, if $k \geq d$

$\qquad \sum_{i=0}^{d} a_i n^i \leq cn^k$

$\qquad$ divide $n^k => \sum_{i=0}^{d} a_i n^{i-k} \leq c$

$\qquad$ k >= d => i-k $\leq$ 0 => $n^{i-k} \leq 1$

$\qquad$ => Choose $c = \sum_{i=0}^{d} a_i$

c) $p(n) = \sum_{i=0}^{d} a_i n^i$, $a_d > 0$

(ii) – p(n) is $\Theta(n^k)$, if $k = d$

$\qquad c_1 n^k \leq p(n) \leq c_2 n^k$

Note (i) => $c_2 = \sum_{i=0}^{d} a_i$

Find c_1

$\qquad c_1 n^k \leq \sum_{i=0}^{d} a_i n^i$

$\qquad$ divide $n^k => c_1 \leq \sum_{i=0}^{d} a_i n^{i-k}$

$\qquad$ k = d => i-k $\leq$ 0 => $n^{i-k} \leq 1$

$\qquad$ => Choose $c_1 = a_d$

=> $c_1 = a_d$, $c_2 = \sum_{i=0}^{d} a_i$

SUMMARY

Python code

```
[6]  S = [1, 2, 3]
     n = len(S)
     for i in range(n):
         for j in range(n):
             total = S[i] + S[j]
             print(total)
     print('- - - -')
```
